Review

Regression  
Overview

Regression  
Assumptions

Parameter  
Estimation

R Example

- 1 Univariate Observation & Visualization
  - Histograms
  - Bar Plots
  - Density Plots
  - Box Plots
  - QQ Plots
- 2 Multivariate Observation & Visualization
  - Scatter Plots
  - Scatter Plot Matrices
  - Categorical Variable Plots
  - Plots of Principal Components

# Are Data Visualization and Simple Statistics Good Enough?

MLR-1  
5/21

Barnes &  
Quinn

Review

Regression  
Overview

Regression  
Assumptions

Parameter  
Estimation

R Example

- Simple statistics are not sufficient for most engineering problems
  - Adjusting for confound variables.
  - Multiplicity: even low probability events can show significance if we do enough tests.
- Regression and ANOVA provide analytical tools for understanding, prediction, and control in engineering problems.

# Univariate Linear Regression

MLR-1  
6/21

Barnes &  
Quinn

Review

Regression  
Overview

Regression  
Assumptions

Parameter  
Estimation

R Example

- Univariate linear regression reveals the relationship between two variables
- Origin of the name "Regression"? **Francis Galton-pioneer of statistics.**

# Regression to the Mean

MLR-1  
7/21

Barnes &  
Quinn

Review

Regression  
Overview

Regression  
Assumptions

Parameter  
Estimation

R Example

- The original paper by Galton, which regressed sons heights on the heights of fathers, exposed a common fallacy: Regression to the Mean.

- Another example: Israeli Air Force - Kahneman

# Multiple Regression Summary

Regression  
Overview

Regression  
Assumptions

Parameter  
Estimation

R Example

- Multiple Regression: A method for measuring and modeling the relationship between sets of variables.

# Multiple Regression Summary

MLR-1  
9/21

Barnes &  
Quinn

Review

Regression  
Overview

Regression  
Assumptions

Parameter  
Estimation

R Example

- Examples:
  - Relationship between SAT score and high school grades, gender, preparation courses, ...
  - Relationship between number of crimes and incomes, population, police, ...
  - Relationship between salary and years experience, gender, age, ...
- Relationship does not imply causation.

# Linear Regression Models

MLR-1  
10/21

Barnes &  
Quinn

Review

Regression  
Overview

Regression  
Assumptions

Parameter  
Estimation

R Example

- Regression models are one type of mathematical model. Models allow us to focus attention to the key elements that describe or predict a system's performance.
- Types of mathematical models:
  - Functional:  $y = f(x)$
  - Stochastic:  $y = f(x) + \epsilon$  where  $\epsilon$  is a random variable.
- Linear regression uses stochastic models with two components:
  - Deterministic:  $f(x) = \beta_0 + \beta_1 x_1 + \dots + \beta_k x_k$  and
  - **Stochastic:**  $\epsilon$
- Matrix notation:  $y = f(X) + \epsilon = X\beta + \epsilon$ 
  - If we have  $n$  observations, what are dimensions of  $y$ ,  $X$ ,  $\beta$ , and  $\epsilon$ ?

# Terminology of Linear Regression Models

MLR-1  
11/21

Barnes &  
Quinn

Review

Regression  
Overview

Regression  
Assumptions

Parameter  
Estimation

R Example

## Linear Regression Model

$$y = \beta_0 + \beta_1 x_1 + \cdots + \beta_k x_k + \epsilon$$

- $y$ : *response variable, predicted variable, regressand, dependent variable, outcome variable*
- $x_i$ : *explanatory variable, predictor variable, regressor, independent variable, input variable*
- $\beta_0$ : *intercept*
- $\beta_i (i = 1, \dots, k)$ : *regression coefficients, effects*
- $\epsilon$ : *error term, residual, noise*

# Metric of Goal for Regression

MLR-1  
12/ 21

Barnes &  
Quinn

Review

Regression  
Overview

Regression  
Assumptions

Parameter  
Estimation

R Example

- Regression is the solution to an optimization problem.
- Find a linear fit to the data that minimizes the sum of square errors.
- Why do we use the metric sum of square errors?

# Assumptions for Optimization

MLR-1  
13/ 21

Barnes &  
Quinn

Review

Regression  
Overview

Regression  
Assumptions

Parameter  
Estimation

R Example

- The data for the input variables or predictors,  $x_1, \dots, x_k$  are known.
- The predictors are **linearly independent**.
- The response variable,  $y$ , is quantitative.

# Assumptions for Inference

MLR-1  
14/ 21

Barnes &  
Quinn

Review

Regression  
Overview

Regression  
Assumptions

Parameter  
Estimation

R Example

- For a sample size of  $n$ , the distribution of the  $\epsilon_i, i = 1, \dots, n$  are **independent, identical and Gaussian** with
  - $E(\epsilon_i) = 0$ , and
  - $Var(\epsilon_i) = \sigma^2$
  - What's the distribution of  $Y_i$ ?
    - The above assumptions imply that  $Y_i$  also have Gaussian distributions with  $E(Y_i) = X_i\beta$  and  $Var(Y) = \sigma^2$ .
- Hence,  $Y$  is multivariate Gaussian with  $E(Y) = X\beta$  and  $Var(Y) = \sigma^2$

# Least Squares Estimates

MLR-1

15/ 21

Barnes &  
Quinn

Review

Regression  
Overview

Regression  
Assumptions

Parameter  
Estimation

R Example

- We find optimal estimates for the coefficients  $\beta$  where the criterion is least squares.
- The optimization problem is:

$$\text{minimize} \sum_{i=1}^n (\beta_0 + \beta_1 x_{i1} + \cdots + \beta_k x_{ik} - y_i)^2$$

or

$$\text{minimize} (X\beta - y)^T (X\beta - y)$$

- The least square estimate?

$$\hat{\beta} = (X^T X)^{-1} X^T y$$

# Estimation of Variance

MLR-1  
16/21

Barnes &  
Quinn

Review

Regression  
Overview

Regression  
Assumptions

Parameter  
Estimation

R Example

- The estimate for  $\sigma^2$  where  $k$  is the number of predictors or input variables:

$$\begin{aligned}\hat{\sigma}^2 &= \frac{(X\hat{\beta} - y)^T(X\hat{\beta} - y)}{n - k - 1} \\ &= \frac{y^T(I - H)y}{n - k - 1}\end{aligned}$$

- $H = X(X^T X)^{-1}X^T$  is the hat matrix:  $\hat{y} = X\hat{\beta} = Hy$
- So,

$$\hat{\sigma}^2 = \frac{\hat{\epsilon}^T \hat{\epsilon}}{n - k - 1}$$

# Sum of Squares Decomposition

MLR-1  
17/21

Barnes &  
Quinn

Review

Regression  
Overview

Regression  
Assumptions

Parameter  
Estimation

R Example

- The sum of squares has a convenient decomposition:

$$\begin{aligned}\sum_{i=1}^n (y_i - \bar{y})^2 &= \sum_{i=1}^n (y_i - \hat{y}_i + \hat{y}_i - \bar{y})^2 \\ &= \sum_{i=1}^n (y_i - \hat{y}_i)^2 + (\hat{y}_i - \bar{y})^2\end{aligned}$$

**Total S.S. = Residual S.S + Model S.S**

- This decomposition is important and useful. Why?

# ANOVA Table and F Test

MLR-1  
18/ 21

Barnes &  
Quinn

Review

Regression  
Overview

Regression  
Assumptions

Parameter  
Estimation

R Example

- Model Utility Test:

$$H_0 : \beta_1 = \dots = \beta_k = 0$$

$$H_A : \beta_i \neq 0, i \in \{1, \dots, k\}$$

- ANOVA table and F test

Source	Sum of Squares	d.f	Mean Square
Model	$\sum_{i=1}^n (\hat{y}_i - \bar{y})^2$	$k$	$\frac{\sum_{i=1}^n (\hat{y}_i - \bar{y})^2}{k}$
Residual	$\sum_{i=1}^n (y_i - \hat{y}_i)^2$	$n - k - 1$	$\frac{\sum_{i=1}^n (y_i - \hat{y}_i)^2}{n - k - 1}$
Total	$\sum_{i=1}^n (y_i - \bar{y})^2$	$n - 1$	Sample Var.

Source	F	Pr(F)
Model Utility	$\frac{\frac{\sum_{i=1}^n (\hat{y}_i - \bar{y})^2}{k}}{\frac{\sum_{i=1}^n (y_i - \hat{y}_i)^2}{n - k - 1}}$	$F_{(k, n - k - 1)}$

# F-test

MLR-1  
19/21

Barnes &  
Quinn

Review

Regression  
Overview

Regression  
Assumptions

Parameter  
Estimation

R Example

- F-statistic with  $k$  and  $n - k - 1$  degrees of freedom

$$F = \frac{\frac{\sum_{i=1}^n (\hat{y}_i - \bar{y})^2}{k}}{\frac{\sum_{i=1}^n (y_i - \hat{y}_i)^2}{n - k - 1}}$$

- The larger the  $F$  statistic, the more useful the model.

# t-tests

MLR-1  
20/ 21

Barnes &  
Quinn

Review

Regression  
Overview

Regression  
Assumptions

Parameter  
Estimation

R Example

- Hypotheses:

$$H_0 : \beta_i = 0$$

$$H_A : \beta_i \neq 0$$

- t-statistic with  $n - k - 1$  d.f.:

$$t = \frac{\hat{\beta}_i}{s_{\hat{\beta}_i}}$$

- Check whether the particular X is useful given the presence of other variables.

# Example: Equipment Damage in Train Control

MLR-1  
21/ 21

Barnes &  
Quinn

Review

Regression  
Overview

Regression  
Assumptions

Parameter  
Estimation

R Example

- It's easy to estimate linear regression models in R: *lm*
- Predict *EQPDMG* using TEMP + TRNSPD + TONS:

Variable	Estimate	Std. Error	t value	$Pr(>  t )$
(Intercept)	220.3323	3181.6674	0.069	0.9448
TEMP	-95.7136	48.6011	-1.969	0.0489
TRNSPD	2917.5473	64.6640	45.119	<2e-16
TONS	9.3293	0.2346	39.763	<2e-16

- $F$  test results: 1477 on 3 and 40087 d.f, p-value:  
<  $2.2e - 16$
- Interpret these coefficients and the  $F$  test result.
